

5.3.9 Internal clock timing characteristics

The parameters given in the tables below are derived from tests performed under ambient temperature and supply voltage conditions summarized in Table 16. The curves provided are characterization results, not tested in production.

1. Tested in production.
2. Specified by design - Not tested in production.
3. Evaluated by characterization - Not tested in production.
4. $\Delta f_{\text{HSI}} = \Delta_{\text{TEMP}} + \Delta_{V_{\text{DD}}}$
5. These values are obtained by using formula: $(\text{Freq}(3.6 \text{ V}) - \text{Freq}(3.3 \text{ V})) / \text{Freq}(3.3 \text{ V})$ or $(\text{Freq}(3.6 \text{ V}) - \text{Freq}(2.7 \text{ V})) / \text{Freq}(2.7 \text{ V})$.
6. The supply regulation consumption is common to HSI and PSI. (To be counted once if both oscillators are ON).
7. Jitter measurements are performed without clock source activated in parallel. Typical value is standard deviation, Maximum is peak measure on TIE-8 over 36 cycles.
8. Jitter measurements are performed without clock source activated in parallel. Typical value is standard deviation, Maximum is peak measure on TIE-16 over 36 cycles.
